Exercise 36: Let R be a noetherian integral domain, which is not a field, such that each ideal is a finite product of prime ideals.

Show that R is a PID if and only if R is a UFD and dim(R) = 1.

Note, a noetherian ID of dimension one where each ideal is a product of primes is called a Dedekind domain and has by Exercise 32 "unique prime factorisation" for ideals!

Exercise 37: Give an example of a ring R with two "maximal" chains of prime ideals of different length.

Exercise 38: Let K be a field and \overline{K} its algebraic closure.

Show that $\overline{K}[x_1, \dots, x_n]$ is integral over $K[x_1, \dots, x_n]$.

Exercise 39: [Rings of Invariants]

Let G be a *finite* group and $R = K[\underline{x}]/I$ a finitely generated K-algebra, $G \to Aut_{K-alg}(R)$ a group homomorphism (we say that G *acts* on R via K-algebra automorphisms), and write $g \cdot f := \alpha(g)(f)$ for $g \in G$ and $f \in R$. Moreover, consider $R^G = \{f \in R \mid g \cdot f = f \ \forall \ g \in G\}$, the *ring of invariants of* G *in* R.

- a. Show that R is integral over RG.
- b. Show that R^G is a finitely generated K-algebra, hence noetherian.
- c. Let $Mon(\underline{x}) = \{0\} \cup \{\underline{x}^{\alpha} \mid \alpha \in \mathbb{N}^n\}$, $Mon(f) = \{\underline{x}^{\alpha} \mid \alpha_{\alpha} \neq 0\}$ for $0 \neq f = \sum_{\alpha} \alpha_{\alpha} \underline{x}^{\alpha} \in K[\underline{x}]$ and $Mon(0) = \{0\}$. We define a *well-ordering* on $Mon(\underline{x})$ by $\underline{x}^{\alpha} > 0$ for all α and

$$\begin{array}{lll} \underline{x}^{\alpha} > \underline{x}^{\beta} & \Longleftrightarrow & deg(\underline{x}^{\alpha}) > deg(\underline{x}^{\beta}) & or \\ & (deg(\underline{x}^{\alpha}) = deg(\underline{x}^{\beta}) & and & \exists \ i \ : \alpha_{1} = \beta_{1}, \ldots, \alpha_{i-1} = \beta_{i-1}, \alpha_{i} > \beta_{i}), \end{array}$$

and we call lm(f) = max(Mon(f)) the *leading monomial of* f.

Show,
$$(\underline{x}^{\alpha} > \underline{x}^{\beta} \implies \underline{x}^{\alpha} \cdot \underline{x}^{\gamma} > \underline{x}^{\beta} \cdot \underline{x}^{\gamma})$$
, and thus $lm(f \cdot g) = lm(f) \cdot lm(g)$.

d. Consider the group homomorphism

$$\begin{aligned} Sym(n) &\longrightarrow Aut_{K-\alpha lg}\left(K[x_1,\ldots,x_n]\right): \sigma \mapsto (f \mapsto f(x_{\sigma(1)},\ldots,x_{\sigma(n)}), \\ \text{and the polynomial } (X+x_1) \cdots (X+x_n) &= X^n + s_1 X^{n-1} + \ldots + s_n \in K[x_1,\ldots,x_n][X]. \\ \text{Show, } K[x_1,\ldots,x_n]^{Sym(n)} &= K[s_1,\ldots,s_n]. \end{aligned}$$

Hint, use Exercise 28 to solve part b., for part d. show first that $\underline{x}^{\alpha} = lm(f)$ for $f \in K[x_1, \dots, x_n]^{Sym(n)}$ implies $\alpha_1 \geq \dots \geq \alpha_n$, and deduce that there is a $g \in K[s_1, \dots, s_n]$ such that lm(f) = lm(g). Use this to do induction on lm(f) in order to show that actually $f \in K[s_1, \dots, s_n]$. Note that $s_i = \sum_{1 \leq j_1 < \dots < j_i \leq n} x_{j_1} \cdots x_{j_i}$, so what is $lm(s_i)$?
